## Examining the role of monetary aggregates in China

### Abstract

The paper examines the relative significance of monetary aggregates and interest rates in China using the information approach to monetary policy. The analysis reveals the superiority and robustness of a narrow monetary aggregate in contributing information about future movements in inflation.

JEL classification: E52.

Keywords: monetary policy and inflation; information approach; monetary aggregates; interest rates; China.

# 1 Introduction

Monetary policy making involves exploring the past, present and potential future states of the economy using a range of economic models and indicators. Academic interest in the topic goes back at least to Milton Friedman's endorsement of monetary aggregates and includes efforts at extracting information from large datasets. But deciding exactly what role, if any, an indicator of aggregate economic conditions ultimately plays in designing and implementing monetary policy is an ongoing source of debate in the literature (Woodford, 2008; McCallum and Nelson, 2011).

The investigation contributes to the debate by examining the potential role of monetary aggregates in China using the information approach (e.g. Friedman and Kuttner, 1992). The paper seeks to answer the following question: Do monetary aggregates, contending alongside interest rates, contain useful information about future inflation in China? The approach seems potentially fruitful for a fast-growing economy with an unconventional and evolving monetary policy framework. And examining non-interest rate measures of monetary policy appears sensible in the light of the balance-sheet policies of many central banks around the world since 2008.

Since 1998 the People's Bank of China has shown a commitment to pursuing a market-based approach to monetary policy and in that context a variable like the interest rate is expected to be central for maintaining macroeconomic stability (e.g. Goodfriend and Prasad, 2007). China's reforms are extensive and well-documented, and include efforts towards improving the functioning of the money market. So there is no rationale for excluding interest rates from analyses on monetary policy in China on the basis that they do not reflect market conditions.

There is no investigation seeking to ascertain the competing relevance of money and interest rates for future inflation using the information approach as the rationale for the modelling; the closest investigation is Xie (2004). Xie computes regressions using quarterly data on monetary aggregates (M0, M1 and M2) and inflation and finds a significant association. However, the analysis does not consider an interest rate variable alongside monetary aggregates and therefore misses a potentially critical element for understanding China's evolving monetary policy.

This paper focuses on investigating the roles of monetary aggregates and interest rates as possible information variables for monetary policy in China. Information variables

can be used by an optimizing central bank to learn about initial conditions and decide on open market operations, as discussed by Kareken et al (1973). The approach is likely to be relevant in the presence of stochastic shocks affecting key relationships, and if there are concerns about model, parameter or data uncertainty. It is important to distinguish at the outset the information approach from using monetary aggregates as intermediate targets for which money demand analysis is critical or as instruments in a policy rule (see McCallum and Nelson, 2011). Both approaches demand a more reliable statistical link between money and inflation than the information approach (e.g. Estrella and Mishkin, 1997).

## 2 Empirical modeling

The motivation for the empirical modelling is the information approach to monetary policy. The paper's strategy involves using money and an interest rate together to explain movements in inflation. Decisions about using monetary growth or an interest rate alone within a monetary policy framework are prone to suffering the pitfalls deriving from trying to measure the natural rate of interest, or from financial innovation and money demand instability. Furthermore, signals about the monetary policy stance derived from the interest rate alone can be misleading as illustrated by McCallum and Nelson (2011) for the USA economy.

Testing the information approach seeks to ascertain if there is statistically significant information in money and interest rates that is not already contained in inflation. Causality is not relevant in the context of the approach. The analysis runs a battery of autogressions using three monetary aggregates and two interest rates

$$\Delta_{12}p_t = \lambda + \sum_{i=1}^{12} \delta_i \Delta_{12}p_{t-i} + \sum_{i=1}^{12} \beta_{mi} \Delta_{12}m_{t-i} + \varepsilon_t, \quad (1)$$

$$\Delta_{12}p_t = \lambda + \sum_{i=1}^{12} \delta_i \Delta_{12}p_{t-i} + \sum_{i=1}^{12} \beta_{ri} \Delta_{12}r_{t-i} + \xi_t, \quad (2)$$

$$\Delta_{12}p_t = \lambda + \sum_{i=1}^{12} \delta_i \Delta_{12}p_{t-i} + \sum_{i=1}^{12} \beta_{mi} \Delta_{12}m_{t-i} + \sum_{i=1}^{12} \beta_{ri} \Delta_{12}r_{t-i} + u_t. \quad (3)$$

In (1) to (3)  $M$  is a nominal monetary aggregate ( $M0$ ,  $M1$  or  $M2$ ),  $P$  is the price level, and  $R$  is a nominal interest rate -the discount rate ( $Rd$ ) or the lending rate ( $Rl$ ). In the equations small caps denote logs;  $\Delta_{12}$  is the 12-month difference operator, so the variables are expressed in annual growth rates;  $\lambda$ ,  $\delta$ ,  $\beta_m$  and  $\beta_r$  are coefficients to be estimated empirically, while  $\varepsilon$ ,  $\xi$  and  $\mu$  are disturbance terms. The frequency of the economic time series is monthly, ranging from 1999 to 2011, and the sources are the Federal Reserve Bank of St Louis FRED database on China and the International Monetary Fund's international financial statistics. Table A1 contains further details about the data. Figure 1 displays the variables considered in the modelling that follows: all the series are integrated of order zero according to ADF unit root tests including twelve lags, a constant term, and seasonal dummies<sup>1</sup>.

The empirical modelling considers eleven regressions and focuses on the corresponding F statistics. The null hypothesis to be tested is that a subset of coefficients in a given regression is equal to zero, e.g. all the coefficients on a monetary aggregate ( $\Sigma\beta_m$ ), say in equation 1, explaining inflation. Table 1 shows the results from estimating the two-variable systems using  $M0$ ,  $M1$ ,  $M2$ ,  $Rd$ , or  $Rl$  to explain inflation (equations 1 and 2). The F statistics related to the five systems show that only the  $M1$  variable contains significant information about future movements in inflation. None of the F tests in Table 1 is significant at the 5% level excepting the one corresponding to the  $M1$  equation -which is significant at the 1% level.

Table 2 displays the F statistics for three-variable systems analogous to equation 3. The systems include one of the monetary aggregates ( $M0$ ,  $M1$  or  $M2$ ) alongside one of the interest rate variables ( $Rd$  or  $Rl$ ). The null hypothesis to be tested is that a subset of coefficients in a regression is equal to zero. The results confirm the findings from the two-variable modelling displayed in Table 1: only the  $M1$  monetary aggregate contains significant information on inflation (at the 1% level), even when competing alongside any of the two interest rate variables.

The relevance of the findings so far depends on the stability of a given relationship. The stability or otherwise a relationship, in turn, reflects the evolution of the institutional setting in China, the wider economic environment and changes in the practise of monetary policy. The investigation proceeds by estimating the regression containing infla-

---

<sup>1</sup> The sample for the ADF tests is 2001.2-2011.12 and the corresponding statistics are: inflation (-3.76),  $M0$

tion and M1 recursively. Figure 2 displays two recursive tests: 1-step-ahead forecast residuals together with two-error fans and the 1-step Chow test alongside the corresponding 1% significance line. Both graphs confirm the stability of the regression, with only two observations appearing barely outside the confidence fans in Figure 1's upper panel. So the model is stable during the turbulent period encompassing the international financial crisis starting in 2008. That is notable in the light of the substantial build up of credit related to the expansionary policies in China.

### 3 Conclusion

The paper investigates the potential role of monetary aggregates in China using the information approach to monetary policy. The analysis considers three definitions of money and two interest rates. The modelling reveals the superior performance of the M1 monetary aggregate, contending alongside interest rates, in providing information about future movements in inflation. The paper establishes a rationale for using monetary aggregates to inform monetary policy in China without invoking strict theoretical or empirical formalities.

---

(-4.16), M1 (-4.41), M2 (-3.15), Rd (-3.90), and Rl (-3.40). All the statistics are significant at the 5% level.

## Tables and figures

Table 1 F tests for the monetary aggregates and interest rates in the inflation equations 2001-2011

*Systems with two variables*  
The dependent variable is inflation ( $\Delta_{12}p$ )

<b>Variables included in the inflation equation</b>	<b>F tests</b>
$\Delta_{12}m0$	0.36
$\Delta_{12}m1$	<b>0.00**</b>
$\Delta_{12}m2$	0.19
$\Delta_{12}rd$	0.34
$\Delta_{12}rl$	0.30

*Notes:* Each OLS regression (corresponding to equation 1 or 2 in the text) includes 12 lags of inflation, 12 lags of a monetary aggregate (M0, M1, or M2) or the interest rate (Rd or Rl), and seasonal dummies. The second column displays probability values for the F tests generated by each of the five equations. The null hypothesis is that a subset of coefficients in a regression is equal to zero ( $\Sigma\beta_{m0} = 0$ ,  $\Sigma\beta_{m1} = 0$ ,  $\Sigma\beta_{m2} = 0$ ,  $\Sigma\beta_{rd} = 0$ , and  $\Sigma\beta_{rl} = 0$ ). \*\* denotes significance at the 1% level.

Table 2 F tests for the monetary aggregates and interest rates in the inflation equations 2001-2011

*Systems with three variables*  
The dependent variable is inflation ( $\Delta_{12}p$ )

Variables included in the inflation equation	F tests	
	Monetary aggregate	Interest Rate
$\Delta_{12}m0, \Delta_{12}rd$	0.44	0.42
$\Delta_{12}m1, \Delta_{12}rd$	<b>0.00**</b>	0.17
$\Delta_{12}m2, \Delta_{12}rd$	0.31	0.47
$\Delta_{12}m0, \Delta_{12}rl$	0.41	0.35
$\Delta_{12}m1, \Delta_{12}rl$	<b>0.00**</b>	0.26
$\Delta_{12}m2, \Delta_{12}rl$	0.10	0.16

*Notes:* Each OLS regression (corresponding to equation 3 in the text) includes 12 lags of inflation, 12 lags of each of the two additional variables (M0, M1, or M2, and Rd or Rl), and seasonal dummies. The second and third columns display probability values for the F tests generated by the six different specifications and show if a subset of coefficients in a regression is equal to zero ( $\Sigma\beta_{m0} = 0$ ,  $\Sigma\beta_{m1} = 0$ ,  $\Sigma\beta_{m2} = 0$ ,  $\Sigma\beta_{rd} = 0$ , and  $\Sigma\beta_{rl} = 0$ ). \*\* denotes significance at the 1% level.

Table A1 Data appendix

Series descriptions	FRED codes
Consumer price index: All items for China (P), 2005 = 100, NSA	CHNCPIALLMINMEI
Discount rate, percent per annum (Rd), NSA	INTDSRCNM193N
Lending rate, percent per annum (Rl), NSA	92460P..ZF... (IMF code)
M0, national currency, NSA. M0 comprises currency issued by the PBC less the amount held by banking institutions.	MYAGM0CNM189N
M1, national currency, NSA. M1 comprises currency in circulation plus demand deposits in national currency of resident non-bank non-government sectors with the PBC and banking institutions. Currency in circulation refers to notes and coins by the PBC less the amount held by banking institutions.	MYAGM1CNM189N
M2, national currency, NSA. M2 comprises M1 plus time and savings deposits in national currency of resident non-bank financial corporations and non-bank non-government sectors with the PBC and banking institutions.	MYAGM2CNM189N
